

IN THE SPECIFICATION

Please delete the following paragraphs from Page 2, line 5 thru 15 and insert on page 2, after the title "Summary Of The Invention":

The technology discussed above cannot generate an exterior division voltage. Other technologies can generate an exterior division voltage but is inferior in the viewpoint of the power consumption and circuit area because two amplifiers are required and connections are also complicated. Moreover, since the resistance value of the resistance element generally includes large a fluctuation, there is a problem in the accuracy of the divided voltage generated.

Considering the background described above, the present invention to provides a low power consumption integrated circuit of small area which can generate an exterior division voltage of higher accuracy.
